Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Dermaseptin subfamily. Amphibian defense peptide; Antibiotic; Direct protein sequencing. SEQUENCE 33 AA; 3153 MM; 2A6A282029A47547 CRC64;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -I. FUNCTION: Antibacterial activity against Gram-positive bacterium S.aureus and B.faecalis, and Gram-negative bacterium P.aeruginosa and E.coli. Has antiprotozoal activity against T.cruzi.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Skin.
-!- MASS SPECIFOMETRY: MM=3154.0; METHOD=Electrospray; RANGE=1-33; NOTE=Ref.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE=99404773; PubMed=10477123; DOI=10.1016/S0196-9781(99)00050-9; Batista C.V.F., da Silva L.R., Sebben A., Scaloni A., Ferrara L., Paiva G.R., Olamendi-Portugal T., Possani L.D., Bloch C.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Habberli S., Kuhn-Nentwig E., Schaller J., Nentwig W.;

"Characterisation of antibacterial activity of peptides isolated from the venom of the spider Cupiennius salei (Araneae: Ctenidae).";

Toxicon 38:373-380(2000).

-! FUNCTION: Has antimicrobial activity against B.subtilis, E.coli, E.faecalis, P.aeruginosa, and S.aureus. Has insecticidal and hemolytic activities. Probably acts by disturbing membrane function with its amphipathic structure.

-! SUBCELLUIAR LOCATION: Secreted.

-! TISSUE SPECIFICITY: Expressed by the venom gland.

-! ALSSUE SPECIFICITY: Expressed by the venom gland.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE=20132510; PubMed=10669026; DOI=10.1016/S0041-0101(99)00167-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Cupiennin 1, a new family of highly basic antimicrobial peptides in the venom of the spider Cupiennius salei (Ctenidae)."; J. Biol. Chem. 277:11208-11216(2002).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

Claim 10; Page 14; 72pp; English.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides

```
cetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thrombocytopaenia purpura, colitis, contact sease, chronic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthemia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers
   the invention are used as molecular weight markers for glatiramer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 35 AA;

Sampieri F; Herman J, Jullien NCG,

WPI; 2004-332811/31. N-PSDB; ADN11700 Use of nucleotide sequence encoding polypeptide sequence comprising fragment of Pl bacteriophage Cre recombinanse, vector containing nucleotide sequence and polypeptide sequence for regulating Pl bacteriophage Cre recombinase activity.

Claim 15; Page 31; 51pp; English.

Novel peptides are claimed which contain 20-40 amino acids and which have a total cationic charge of less than +21 (pref. +16 to +18; esp. +18) as determined by the number of positively charged amino acids in the sequence. Preferably the positive charges are grouped in clusters separated by neutral amino acids. Especially the peptides contain 28-32 amino acids having blocks of 2-4 positively charged amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) in which selected arguine residues have been replaced with uncharged amino acids and other arguine residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides

reverse the effect of low mol. wt. heparin (LMWH) anticoagulation and hence can be used medically to prevent bleeding after the conclusion of

The present invention relates to the use of a first nucleotide sequence encoding a first polypeptide sequence comprising N-terminal fragment of P1 bacteriophage Cre recombinanse, a second nucleotide sequence encoding a second polypeptide sequence comprising C-terminal fragment of Cre combinase, a vector containing the first and second nucleotide sequences, or first and second polypeptide sequences for regulating activity of P1 bacteriophage Cre recombinase. The sequences are useful for regulating

```
1;
       inducing reciprocal chromosomal translocation, for exchanging one DNA cassette for another by recombinase-mediated cassette exchange and for the inactivation of selected genes in transgenic animals. The present sequence is a polypeptide shown in the exemplification of the invention.
                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New poly:cationic polypeptide n-protamine analogues - having reduced cationic charge and lower toxicity, used for reversing (low mol.wt.)
                                                                                                                                                                                                                                                                                                                               n-protamine; anticoagulation reversal; low molecular weight heparin; polycationic; positively charged amino acid; lysine.

Procualing burging desired from salumning or small broamming to proceed the process of the major components of saluming protein heparin anticogulation. One of the major components of salumine protamine is a 32 amino acid peptide having a total cationic charge of [+21], with argaina accounting for 67% of the total sequence and for all of the positive charge. Peptides of 20-40 amino acids with total cationic charge less than [+21] and which are able, at least partially, to reverse the effect of heparin and/or low modecular weight heparin anticoagulants are claimed. Specifically, the peptides are polycationic analogues of norman where the positive charge on the amino acid sequence is reduced by selective replacement of positively charged arginine residues with an uncharged residue, so that total cationic charge is less than [+21]. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Coagulation, anticoagulant; heparin; platelet aggregation; cell adhesion; positively charged cluster; arginine; polycationic; decrease; n-protamine; salmine protamine; protamine sulphate; salmon sperm.
clinical procedures using heparin therapy. They are less toxic than n-protamine since the reduced positive charge gives an improved efficiency to toxicity ratio; and they may be more effective than n-protamine in their anti-LMWH action. The present sequence (total cationic charge = +18) is a specific example of the new polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3. 30

                                                     y and inexpensive to prepare. The present sequence represents a cific example of a protamine-like peptide with a charge of [+18] which been found to reverse the anticoagulation effects of both standard
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a synthetic peptide which has a high affinity for glycoaminoglycans and proteoglycans. The peptide is useful in methods for modulating heparin or other glycoaminoglycans with anticoagulant activity, promoting cell attachment or adhesion to natural or synthetic surfaces (especially vein grafts), modulating tumour cell metastasis, modulating cartilage differentiation, targeting drugs to epithelial cell surfaces (or to other cells expressing proteoglycans), modulating enzymes that act on glycoaminoglycan substrates, affinity purification of bioactive sequences of a glycoaminoglycan, modifying endothelial cell pro-coagulant or anti-coagulant functions mediated through glycoaminoglycans, and modulating wound healing. The peptide may also be used for blocking tissue uptake of heparin or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel synthetic peptides with high affinity for glycoaminoglycans and proteoglycans, useful for modulating heparin, promoting cell attachment, modulating tumor metastasis and modulating wound healing.
peptides are used in vivo to reverse the effects of heparin; they the same anti-heparin activity as protamine but are less toxic sause of the reduced number of positive charges? and are relatively
                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glycoaminoglycan; proteoglycan; heparin modulation; anticoagulant; cell attachment; cell adhesion; vein graft; tumour cell metastasis; cartilage differentiation; wound healing.

a total cationic charge of less than +21 (pref. +16 to +18; esp. +18) as determined by the number of positively charged amino acids in the sequence. Preferably the positively charged amino acids in the sequence. Preferably the positive charges are grouped in clusters separated by neutral amino acids. Especially the peptides contain 28-32 amino acids having blocks of 2-4 positively charged amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) in which selected arginine residues have been replaced by their positively charged amino acid residues, preferably lysine. The peptides reverse the effect of low mol. Wt. heparin (LMWH) anticoagnlation and hence can be used medicially to prevent bleeding after the conclusion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel peptides are claimed which contain 20-40 amino acids and which have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               clinical procedures using heparin therapy. They are less toxic than n-protamine since the reduced positive charge gives an improved efficiency to toxicity ratio; and they may be more effective than n-protamine in their anti-lMWH action. The present sequence (total cationic charge = +16) is a specific example of the new polypeptides

Protamine sulphate (also called n-protamine or salmine protamine) is a polycationic peptide derived from salmon sperm and is used to reverse the parin anticoagulation. One of the major components of salmine protamine is a 32 amino acid peptide having a total cationic charge of [421], with carginine accounting for 67% of the total sequence and for all of the cost into acid peptides of 20-40 amino acids with total cationic charge less than [421] and which are able, at least partially, to reverse the effect of heparin and/or low molecular weight heparin anticoagulants are claimed. Specifically, the peptides are polycationic analogues of nortamine where the positive charge on the amino acid sequence is reduced by selective replacement of positively charged arginine residues with an uncharged residue, so that total cationic charge is less than [+21]. The nortation and provides are used in vivo to reverse the effects of heparin; hey have the same anti-heparin activity as protamine but are less toxic (because of the reduced number of positive charges) and are relatively
                          1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   easy and inexpensive to prepare. The present sequence represents a specific example of a protamine-like peptide with a charge of [+18] which has been found to reverse the anticoagulation effects of both standard and low molecular weight heparin
                                                                                                                                                                                                                                                                                                                                   Coagulation; anticoagulant; heparin; platelet aggregation; cell adhesion; positively charged cluster; arginine; polycationic; decrease; n-protamine; salmine protamine; protamine sulphate; salmon sperm.

membranes or coatings that absorb specific wavelengths of infrared radiation, and in optical applications e.g., as matrices to align non-linear chromophores which are useful in creating materials for second order non-linear orbits. (II) is useful in hydrogen catalysis, as coatings for blomaterials, saffolds for tissue engineering, ferroelectric materials, artificial muscles, switching devices, etc. This sequence represents a peptide used in the method of the invention.

fabricating block and a solubilizing block, a block for triggering self-
fabrication by external or environmental conditions, and a block for
incorporating turns in the polymer or for providing sites for chemical
modifications, has a molecular weight of 1000-300000 and, in solution,
can self-fabricate to form 3-dimensional material having long-range
order, and where (I) has glycine content of at least 20%. (I) is useful
for controlled delivery of a drug which involves incorporating adrug
the drug. The drug is incorporated whithin layers of the self-fabricating
material. (II) is useful for modifying the optical response of a device
in the near to mid infrared wavelength range which involves applying (II)
cot forms, which can then undergo very specific structural transitions to
form rigid materials. (I) can be used as structural transitions to
form rigid materials. (I) can be used as structural transitions to
form rigid materials. (I) can be used as structural transitions to
form rigid materials. (I) can be used as structural transitions to
cot forms, which can then undergo very specific structural transitions to
form rigid materials. (I) can be used as structural transitions to
cor forms is useful for preparing chemically patterned templates with either
connolithographic processes. A self-fabricated structure containing the
sensitive devices, IR sensors, IR filters, night telescopes and
thermosensitive detectors. (II) can be used for preparing films,
                                                                       ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Miniblock polymer useful in nanolithographic processes, has self-fabricates fabricating block and solubilizing block, has glycine and self-fabricates to form 3-dimensional materials having long-range orders, in solution.

The invention relates to a miniblock polymer (I) comprising a self-fabricating block and a solubilizing block, a block for triggering self-fabrication by external or environmental conditions, and a block for incorporating turns in the polymer or for providing sites for chemical modifications, has a molecular weight of 1000-300000 and, in solution, can self-fabricate to form 3-dimensional material having long-range order, and where (I) has glycine content of at least 20%. (I) is useful for controlled delivery of a drug which involves incorporating a drug within (I), and administering the self-fabricating material, in is useful for modifying the optical response of a device in the near to mid infrared wavelength range which involves applying (II) to the surface of the device (all claimed). (I) is useful for preparing to the surface of the device (all claimed). (I) is useful for preparing long range ordered fluids (i.e., liquid crystals) in a variety of phases

form rigid materials. (1) can be used as structural tissue implants, in liquid crystal displays, and for producing high-performance composites. (1) is useful for preparing chemically patterned templates with either general features are specific features. (1) is also useful in nanolithographic processes. A self-fabricated structure containing the polymer (11) is useful for modifying and improving performance of IR-sensors, IR sensors, IR filters, night telescopes and thermosensitive detectors. (II) can be used for preparing films, membranes no coatings that absorb specific wavelengths of infrared radiation, and in optical applications e.g., as matrices to align nonlinear chromophores which are useful in creating materials for second order non-linear orbits. (II) is useful in hydrogen catalysis, as coating for biomaterials, scaffolds for tissue engineering, ferroalectric materials, artificial muscles, switching devices, etc. This sequence represents a peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of a peptide of potential use for production of a coded probe useful in the method of the invention. The invention provides methods, apparatus and compositions for the detection, identification and/or sequencing of biomolecules, such as nucleic acids or proteins. Coded probes comprising a probe molecule attached to one or more nano-barcodes are allowed to bind to target molecule(s). After binding and separation from unbound coded probes, the bound coded probes are aligned on a surface and analysed by scanning probe microscopy (SPM). The methods allow the sequencing of long nucleic acid sequences in a single sequencing run, high speed of obtaining sequence data, low cost of
                                                                                                                                                                                                                                                                                                 devices, etc. This

Novel peptides are claimed which contain 20-40 amino acids and which have a total cationic charge of less than +21 (pref. +16 to +18; esp. +18) as determined by the number of positively charged amino acids in the sequence. Preferably the positive charges are grouped in clusters separated by neutral amino acids. Especially the peptides contain 28-32 amino acids having blocks of 2-4 positively charged amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) in thich selected arguinne residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides amino acid residues, preferably lysine. The peptides creverse the effect of low mol. Wt. hepatin (LWWH) anticoagulation and hence can be used medically to prevent bleeding after the conclusion of clinical procedures using heparin therapy. They are less toxic than n-protamine since the reduced positive charge gives an improved efficiency
                                                                                                                                           4
sequencing and high efficiency in terms of operator time, and sensitive and accurate detection and/or identification of nucleic acids with low incidence of false positive results.

Novel peptides are claimed which contain 20-40 amino acids and which have a total cationic charge of less than +21 (pref. +16 to +18; esp. +18) as determined by the number of positively charged amino acids in the sequence. Preferably the positive charges are grouped in clusters sequence. Preferably the positive charges are grouped in clusters are acids having blocks of 2-4 positively the positive charge amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) in which selected arguine residues have been replaced with uncharged amino acids and other arguine residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides reverse the effect of low mol. Wt. heparin (LMWH) anticoagulation and hence can be used medically to prevent bleeding after the conclusion of clinical procedures using heparin Inbrapy. They are less toxic than n-protamine since the reduced positive charge gives an improved efficiency
                                                                                                                                             ä
                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New poly:cationic polypeptide n-protamine analogues - having reduced cationic charge and lower toxicity, used for reversing (low mol.wt.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                  n-protamine; anticoagulation reversal; low molecular weight heparin; polycationic; positively charged amino acid; lysine.
to toxicity ratio; and they may be more effective than n-protamine i their anti-LMWH action. The present sequence (total cationic charge +16) is a specific example of the new polypeptides

One of the major components of salmine protamine is a 32 amino acid peptide having a total cationic charge of [+21], with arginine accounting for 67% of the total sequence and for all of the arginine charge. Peptides of 20-40 amino acids with total cationic charge less than [+21] and which are able, at least partially, to reverse the effect of heparin and/or low molecular weight heparin anticoagulants are
                                                                                                                                                                                                                                                                                                                                                                                                                          Coagulation; anticoagulant; heparin; platelet aggregation; cell adhesion; positively charged cluster; arginine; polycationic; decrease; n-protamine; salmine protamine; protamine sulphate; salmon sperm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  claimed. Specifically, the peptides are polycationic analogues of n-
protamine where the positive charge on the amino acid sequence is reduced
by selective replacement of positively charged arginine residues with an
uncharged residue, so that total cationic charge is less than [+21]. The
new peptides are used in vivo to reverse the effects of heparin; they
have the same anti-heparin activity as protamine but are less toxic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2. .29
/label= repeat_region
/note= "4 tandem repeats of Ala(Lys)2(Ala)2(Lys)2 motif"
to toxicity ratio; and they may be more effective than n-protamine in their anti-LMWH action. The present sequence (total cationic charge = +16) is a specific example of the new polypeptides
                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide reversing the anticoagulant effects of heparin - is based on protamine but has fewer positive charges for reduced toxicity.

Peptides of 20-40 amino acids with total cationic charge less than [+21] and which are able, at least partially, to reverse the effect of heparin and/or low molecular weight heparin anticoagulants are claimed. Specifically, the peptides are polycationic analogues of nortanine where the positive charge on the amino acid sequence is reduced by selective replacement of positively charge arginine residues with an uncharged residue, so that total cationic charge is less than [+21]. The
                easy and inexpensive to prepare. The present sequence represents a specific example of a proteamine-like peptide with a charge of [+16] which has been found to reverse the anticoagulation effects of both standard and low molecular weight heparin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Coagulation, anticoagulant; heparin; platelet aggregation; cell adhesion; positively charged cluster; arginine; polycationic; decrease; n-protamine; salmine protamine; protamine sulphate; salmon sperm.

1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated polypeptide of Streptococcus pneumoniae. A polypeptide of the invention has antibacterial, antiinflammatory, and auditory activity, and is used as a vaccine. The polypeptide or pharmaceutical composition is useful for the prophylactic or therapeutic treatment of streptococcal infection, meningitis, otitis media, bacteraemia or pneumonia infection. The kit is useful for detecting or diagnosing streptococcal infection. The pharmaceutical composition is useful as vaccine. The polymucleotides are useful in designing DNA probes for detecting circulating Streptococcus in a biological sample. The present sequence is used in the exemplification of the invention. Note: The sequence data for this patent is not fully information supplied by the European Patent Office
              have the same anti-heparin activity as protamine but are less toxic (because of the reduced number of positive charges) and are relatively easy and inexpensive to prepare. The present sequence represents a specific example of a protamine-like peptide with a charge of [+16] which has been found to reverse the anticoagulation effects of both standard and low molecular weight heparin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polypeptides of Streptococcus pneumoniae, useful for diagnosing, preventing or treating streptococcal infection, meningitis, otitis media, bacteremia or pneumonia infection.

Sequence 10, Application US/08303025

Patent No. 5614494

GENERAL INFORMATION:
APPLICANT: Madefield, Thomas W.
APPLICANT: Andrews, Philip C.
APPLICANT: Stanley, James C.
TITLE OF INVENTION: NOVEL PEPTIDES FOR HEPARIN AND TITLE OF INVENTION: ANTICOAGULATION REVERSAL
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:
ADDRESSEE: Benita J, Rohm, Esq.
STREET: 150 West Jefferson, Suite 2500
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                STATE: STATE: MICHIGAN
COUNTRY: United States of America
ZIP: 49226-4415
ZIP: 49226-4415
ZIP: 49226-4415
ZOMPUTER: EADABLE FORM:
MEDIUM TYPE: Floppy diskette 3.5" 1.44Mb
COMPUTER: IBM FC Compatible
OPERATURG SYSTEM: MS-DOS v.6.22
OFFWARE: WordPerfect 6.1; ASCII (DOS) Text

antifreeze protein GS-5 - grubby sculpin
C;Species: Myoxocephalus aenaeus (grubby sculpin)
C;Species: Myoxocephalus aenaeus (grubby sculpin)
C;Accession: S06417
R;Chakrabartty, A.; Hew, C.L.; Shears, M.; Fletcher, G.
Can. J. Zool, 66, 403-408, 1988
A;Title: Primary structures of the alanine-rich antifreeze polypeptides from grubby sculg
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cipate: 05-Dec-1997 #sequence_revision 05-Dec-1997 #text_change 09-Jul-2004

"Sequence and characterization of the sperm-specific protein phi 3

I sequence and characterization of the sperm-specific protein phi 3

I was a sequence and characterization of the sperm-specific protein transition: histones

I was replaced by spermatid specific proteins which are themselves

Teplaced by protamines in late spermatids.

I will SUGELLANBOUS: The sequence of component I is shown.

Blochim. Blophys. Acta 791:82-86 (1984).

-I- FUNCTION: Protamines substitute for histones in the chromatin of sperm during the haploid phase of spermatogenesis. They compact sperm DNA into a highly condensed, stable and inactive complex.

-I- SUBCELLULAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Chondrichthyes,

Structures of shorthorn sculpin antifreeze polypeptides.";

Eur. J. Biochem. 151:167-172(1985).

-!- FUNCTION: Antifreeze proteins lower the blood freezing point.

-!- SIMILARITY: Belongs to the type-I AFP family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PIR; A41270; A41270.

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

Claim 10; Page 14; 72pp; English.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides

```
treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include arthritic conditions, demyeliated for antibody-mediated diseases and include arthritic conditions, demyeliating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid attributits, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune uveoretinitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxodedma, mysathenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The properties of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers
are used as molecular weight markers for glatiramer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 45 AA;

investion describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acta content of the invention are used as molecular weight markers for glatiramer actate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases such diseases include arthritic conditions, demyelinating arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune carbitis, autoimmune throughly autoimmune uveoretinitis, contact sensitivity disease, diabetes mellitus, Graves disease, dilabin-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, sporiasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, and delayed-type hypersensitivity. The mediated disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptide(s) involved in adhesion of mycobacteria to epithelial cells -

microorganisms over a Heparin-Sepharose column and eluting proteins with a gradient of 0.0.5 M NaCl. Fractions were separated by gel electrophoresis and a 28 kb heparin binding protein purified. N-terminal and internal peptide fractions were sequenced and the amino acid sequences used to design PCR primers. These amplified a 150 bp fragment (AAT76947) used as a probe to isolate chromosomal fragments containing the gene (AAT76948). The gene encodes a protein which is a heparinbinding haemagglutinin antigen (HBHA). The peptide can be used in tuberculosis), or can be used to diagnose mycobacterial infections of tuberculosis), or can be used to diagnose mycobacterial infection (by immunoassay detection of anti-HBHA antibodies) Mycobacterium bovis BCG (Bacille Calmette-Guerin) or M. tuberculosis, which enable mycobacteria to adhere to host, especially epithelial, cells. The antigen was isolated by passing a culture of BCG

New recombinant methylated mycobacterial heparin-binding hemagglutinin, useful as immunogen in anti-tuberculosis vaccines, also vectors for its Disclosure; Fig 2; 41pp; French. preparation.

The invention relates to an immunogenic recombinant peptide which is the methylated form of an expression product of a nucleic acid that encodes a mycobacterial heparin-binding hemagglutinin antigen (HBHA), especially from Mycobacterium bovis BCG or M.tuberculosis. The peptide, also methylated native HBHA, is used to prepare vaccines against mycobacterial peptide is the carboxyterminal of HBHA which binds to heparin. Methylation of this peptide occurs on the side chains of the lysine amino acids with either a methyl or dimethyl group.

Novel peptides are claimed which contain 20-40 amino acids and which have a total cationic charge of less than +21 (pref. +16 to +18; esp. +18) as determined by the number of positively charged amino acids in the sequence. Preferably the positive harges are grouped in clusters sequence. Preferably the positive harges are grouped in clusters amino acids having blocks of 2-4 positively charged amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) in which selected arginine residues have been replaced with uncharged amino acids and other arginine residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides reverse the effect of low mol. Wt. heparin (LMWH) anticoagulation and chence can be used medically to prevent bleeding after the conclusion of clinical procedures using heparin therapy. They are less toxic than n-protamine since the reduced positive charge gives an improved efficiency to toxicity ratio, and they may be more effective than n-protamine in their anti-LMWH action. The present sequence (total cationic charge = +18) is a specific example of the new polypeptides

Novel peptides are claimed which contain 20-40 amino acids and which have a total cationic charge of less than +21 (pref. +16 to +18; esp. +18) as determined by the number of positively charged amino acids in the sequence. Preferably the positive charges are grouped in clusters sequence. Preferably the positive charges are grouped in clusters sequence. Preferably the positive of charges are grouped in clusters amono acids having blocks of 2-4 positively charged amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) the peptides are analogues of n-protamine (total cationic charge = +21) amino acids and other arginine residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides cannon acid residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides charge the effect of low mol. Wt. heparin (LMMH) anticoagning and charge gives an improved efficiency to contacty ratio; and they may be more effective than n-protamine in their anti-LMMH action. The present sequence (total cationic charge = 16) is a specific example of the new polypeptides
                                                                     ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protamine sulphate (also called n-protamine or salmine protamine) is a polycationic peptide derived from salmon sperm and is used to reverse topolycationic opeptide derived from salmon sperm and is used to reverse is a 32 amino acid peptide having a total cationic charge of [421], with carginine accounting for 67% of the total sequence and for all of the positive charge. Peptides of 20-40 amino acids with total cationic charge less than [421] and which are able, at least partially, to reverse the effect of heparin and/or low molecular weight heparin anticoagulants are claimed. Specifically, the peptides are polycationic analogues of n-cromanie where the positive charge on the amino acid sequence is reduced by selective replacement of positively charged arguine residues with an uncharged residue, so that total cationic charge is less than [421]. The new peptides are used in vivo to reverse the effects of heparin; they have the same anti-heparin activity as protamine but are less toxic (because of the reduced number of positive charges) and are relatively easy and inexpensive to prepare. The present sequence represents a specific example of a protamine-like peptide with a charge of [+18] which

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a synthetic peptide which has a high in methods for modulating heparin or other glycoaminoglycans with anticoagulant activity, promoting cell attachment or adhesion to natural or synthetic surfaces (especially vein grafts), modulating tumour cell metastasis, modulating cartilage differentiation, targeting drugs to epithelial cell surfaces (or to other cells expressing proteoglycans), modulating enzymes that act on glycoaminoglycan substrates, affinity purification of bioactive sequences of a glycoaminoglycan, modifying endothelial cell pro-coagulant or anti-coagulant functions mediated through glycoaminoglycans, and modulating wound healing. The peptide may also be used for blocking tissue uptake of heparin or other glycoaminoglycans in a mammal to increase heparin half-life in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel synthetic peptides with high affinity for glycoaminoglycans and proteoglycans, useful for modulating heparin, promoting cell attachment, modulating tumor metastasis and modulating wound healing.
has been found to reverse the anticoagulation effects of both standard and low molecular weight heparin
                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Glycoaminoglycan; proteoglycan; heparin modulation; anticoagulant;

Novel peptides are claimed which contain 20-40 amino acids and which have a total cationic charge of less than +21 (pref. +16 to +18; esp. +18) as determined by the number of positively charged amino acids in the sequence. Preferably the positive charges are grouped in clusters separated by neutral amino acids. Especially the peptides contain 28-32 amino acids having blocks of 2-4 positively charged amino acids separated by blocks of 2-6 neutral acids. Alternatively the positive charge may be distributed evenly or randomly along the peptide sequence. In particular the peptides are analogues of n-protamine (total cationic charge = +21) in which selected arguine residues have been replaced with uncharged amino acids and other arguine residues have been replaced by other positively charged amino acid residues, preferably lysine. The peptides reverse the effect of low mol. wt. heparin (LMMH) anticoagulation and clanced medically to prevent bleeding after the conclusion of clinical procedures using heparin therapy. They are less toxic than n-permine since the reduced positive charge gives an improved efficiency to toxicity ratio; and they may be more effective than n-protamine in their anti-LMWH action. The present sequence (total cationic charge = +16) is a specific example of the new polypeptides

claimed. Specifically, the peptides are polycationic analogues of norotamine where the positive charge on the amino acid sequence is reduced by selective replacement of positively charged arginine residues with an uncharged residue, so that total cationic charge is less than [+21]. The new peptides are used in vivo to reverse the effects of heparin; they have the same anti-heparin activity as protamine but are less toxic (because of the reduced number of positive charges) and are relatively easy and inexpensive to prepare. The present sequence represents a specific example of a protamine-like peptide with a charge of [+16] which has been found to reverse the anticoagulation effects of both standard
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protamine sulphate (also called n-protamine or salmine protamine) is a polycationic peptide derived from salmon sperm and is used to reverse heparin anticoagulation. One of the major components of salmine protamine is a 32 amino acid peptide having a total cationic charge of [+21], with arginine accounting for 67% of the total sequence and for all of the positive charge. Peptides of 20-40 amino acids with total cationic charge less than [+21] and which are able, at least partially, to reverse the effect of heparin and/or low molecular weight heparin anticoagulants are
                                                                                                                                                                                                                                     Coagulation; anticoagulant; heparin; platelet aggregation; cell adhesion; positively charged cluster; arginine; polycationic; decrease; n-protamine; salmine protamine; protamine sulphate; salmon sperm.
                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "4 tandem repeats of Ala(Lys)2(Ala)2(Lys)2 motif"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide reversing the anticoagulant effects of heparin - is based on protamine but has fewer positive charges for reduced toxicity.

Protamine sulphate (also called n-protamine or salmine protamine) is a polycationic peptide derived from salmon sperm and is used to reverse theparin anticoagulation. One of the major components of salmine protamine is a 32 amino acid peptide having a total cationic charge of [+21], with carginine accounting for 67% of the total sequence and for all of the cost that charge is a 12 amino acid peptides of 20-40 amino acids with total cationic charge less than [+21] and which are able, at least partially, to reverse the effect of heparin and/or low molecular weight heparin anticoagulants are claimed, Specifically, the peptides are polycationic analogues of n-cramine where the positive charge on the amino acid sequence is reduced by selective replacement of positively charged arginine residues with an uncharged residue, so that total cationic charge is less than [+21]. The new peptides are used in vivo to reverse the effects of heparin; they have the same anti-heparin activity as protamine but are less toxic (because of the reduced number of positive charges) and are relatively
                                                                                                                                                                                                                                                                               Coagulation; anticoagulant; heparin; platelet aggregation; cell adhesion; positively charged cluster; arginine; polycationic; decrease; n-protamine; salmine protamine; protamine sulphate; salmon sperm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              charge of [+16] which
